# Getting Started

- Login to the RC Jupyter Hub:

`https://jupyter.rc.colorado.edu`

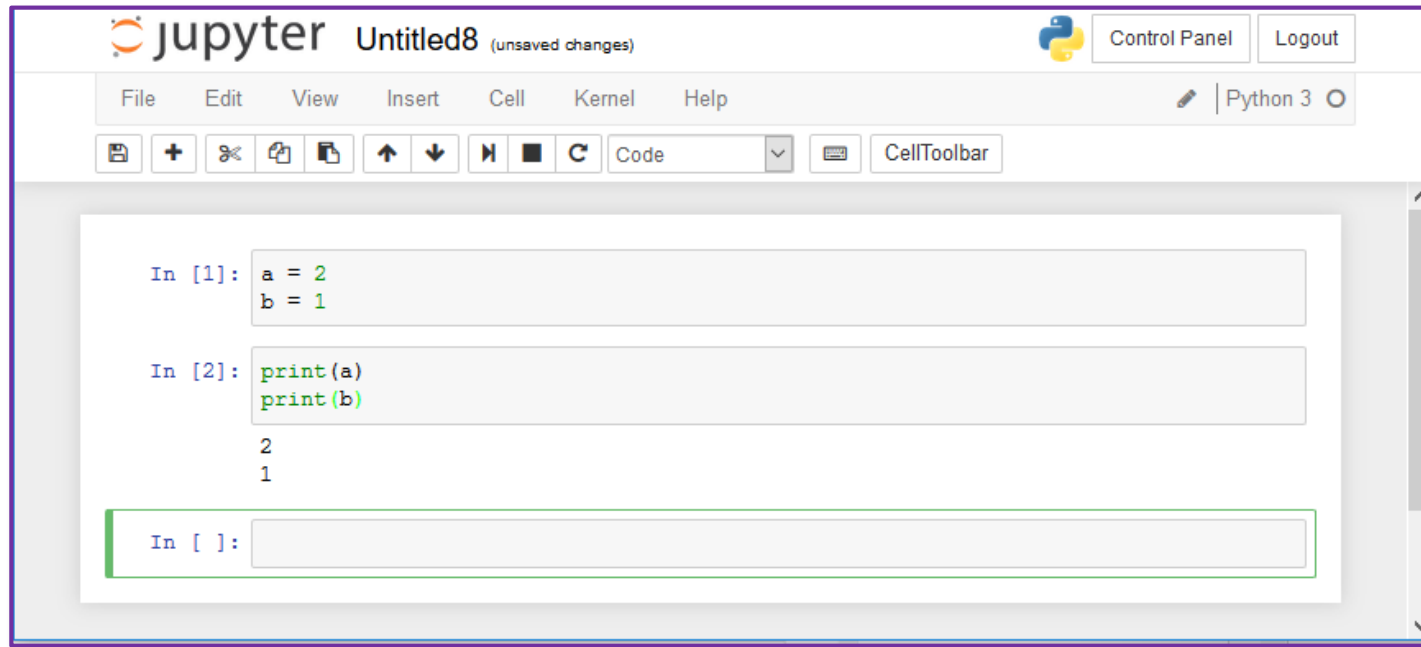

# Getting Started...

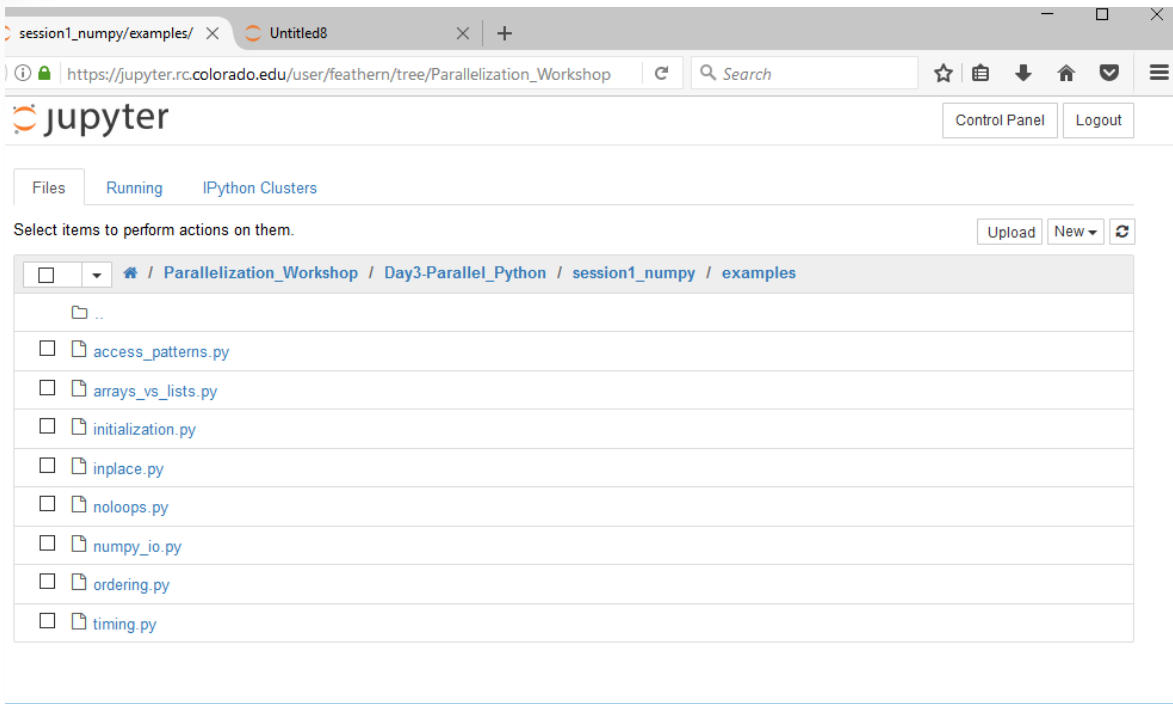

Start a Python 3  
Notebook

# So how does this work?

- Pressing “enter” moves to next line
- Pressing “shift” + “enter” executes code block
- Variables remain in memory between blocks...

# File browser tab remains open...

Open this file:

Parallelization Workshop /  
Day3-Parallel\_Python /  
session1\_numpy /  
examples /  
**timing.py**

*Workflow for today:*

- Open file in file browser
- Cut + paste into notebook tab
- “shift” + “enter”

# Timing in Python...

- Timing via “time” module
- Let’s look at **timing.py**
- time() returns seconds elapsed since some reference time.

Parallelization Workshop /  
Day3-Parallel\_Python /  
session1\_numpy /  
examples /  
**timing.py**

```
import time
```

*usage pattern*

```
t0 = time.time()
```

```
... code you want to time ...
```

```
t1 = time.time()
```

```
dt = t1-t0
```

```
print ('Calculation time in seconds: ', dt)
```
